

**WHAT IS CLAIMED IS:**

Sub B7

1. A method for searching different data stores based on a classification of a search term, the method comprising:  
 receiving at least one search term;  
 classifying the search term among at least first and second categories;  
 when the search term is classified within the first category, comparing the search term to first electronic information within a first electronic information store to determine whether matches exist;  
 when the search term is classified within the second category, comparing the search term to at least second electronic information within at least a second electronic information store that differs from the first electronic information store to determine whether matches exist; and  
 displaying a result based on the matches that are determined to exist.

2. The method of claim 1 wherein comparing the search term when the search term is classified within the second category comprises comparing the search term to the first electronic information within the first electronic information store and to the second electronic information within the second electronic information store.

3. The method of claim 1 wherein:  
 receiving at least one search term comprises receiving several search terms and grouping the search terms received as a single string;  
 classifying the search term comprises classifying the single string of search terms among at least first and second categories;  
 comparing the search term when the single string of search terms is classified within the first category comprises comparing the single string of search terms to the first electronic information within the first electronic information store to determine whether matches exist;  
 and  
 comparing the search term when the single string of search terms is classified within the second category comprises comparing the single string of search terms to the second

Sub B7

12 electronic information within the second electronic information store to determine whether  
13 matches exist.

1 4. The method of claim 1 wherein the first electronic information includes  
2 contents relating to non-offensive web sites and the second electronic information includes  
3 contents relating to offensive web sites.

1 5. The method of claim 1 wherein the method is performed by a web host having  
2 members and the method further comprises:  
3 automatically scanning contents of a web site when the web site is accessed by  
4 members of the web host;

5 classifying the contents of the web site among at least one of the first electronic  
6 information within the first electronic information store and the second electronic  
7 information within the second electronic information store;

8 storing the contents of the web site in the first electronic information within the first  
9 electronic information store when the contents of the web site are classified among the first  
10 electronic information; and

11 storing the contents of the web site in the second electronic information within the  
12 second electronic information store when the contents of the web site are classified among  
13 the second electronic information.

1 6. The method of claim 5 wherein the first electronic information store is located  
2 on a first server and the second electronic information store is located on a second server that  
3 differs from the first server.

1 7. The method of claim 1 wherein the first electronic information includes full  
2 text, titles, descriptions, and addresses of web sites such that the comparing the search term  
3 to the first electronic information within the first electronic information store comprises  
4 comparing the search term to the full text, the titles, the descriptions, and the addresses of  
5 web sites to determine whether matches exist.

Sub B17

1 15. The system of claim 14 wherein the first electronic information store is  
2 included on a first server and the second electronic information store is included on a second  
3 server that differs from the first server.

1 16. A computer program, stored on a computer readable medium, for searching  
2 different data stores based on a classification of a search term, comprising instructions for:  
3 receiving at least one search term;  
4 classifying the search term among at least first and second categories;  
5 when the search term is classified within the first category, comparing the search term  
6 to first electronic information within a first electronic information store to determine whether  
7 matches exist;  
8 when the search term is classified within the second category, comparing the search  
9 term to at least second electronic information within at least a second electronic information  
10 store that differs from the first electronic information store to determine whether matches  
11 exist; and  
12 displaying a result based on the matches that are determined to exist.

1 17. The computer program of claim 16 wherein the computer readable medium  
2 comprises a propagated signal.

1 18. The computer program of claim 17 wherein the propagated signal comprises a  
2 carrier wave.

1 19. A computer program, stored on a computer readable medium, for storing  
2 searchable contents into more than one distinct data store, comprising instructions for:  
3 receiving content;  
4 classifying content among a first electronic information store and a second electronic  
5 information store; and  
6 storing the content based on the classifying among the first electronic information  
7 store and the second electronic information store.

Sub B17

ocket No.: 06975-146001

1 20. The computer program of claim 19 wherein the computer readable medium  
2 comprises a propagated signal.

1 21. The computer program of claim 20 wherein the propagated signal comprises a  
2 carrier wave.
